

Experiment 9

Aim: To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with containers.

THEORY:

What is Docker?

Docker is a platform that allows developers to build, package, and deploy applications in lightweight, portable containers. These containers include everything needed to run an application, such as code, runtime, system tools, libraries, and dependencies.

Containerization Technology

Containers are isolated environments where applications run independently. Unlike traditional virtualization, which requires separate operating systems for each application, containers share the host OS kernel, making them faster and more efficient.

Docker Architecture

Docker follows a client-server architecture consisting of the following key components:

1. Docker Client

- It is the command-line interface (CLI) that allows users to interact with Docker.
- Commands such as `docker run`, `docker build`, and `docker stop` are executed through the client.

2. Docker Daemon (dockerd)

- It runs in the background and manages Docker containers, images, volumes, and networks.
- It listens for requests from the Docker Client and executes commands.

3. Docker Images

- A Docker image is a read-only template containing the application code, libraries, and dependencies.

Experiment 9

Aim: To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with containers.

- Images are created using Dockerfiles, which define the steps to build an image.
- Images are stored in Docker Hub or private repositories.

4. Docker Containers

- A container is an instance of a Docker image running as an isolated process on a host machine.
- Containers are lightweight, portable, and can be started, stopped, or removed as needed.

5. Docker Registry

- It is a storage system for Docker images.
- The public registry, Docker Hub, provides access to a vast collection of pre-built images.
- Users can also create private registries for security and control.

Docker Container Life Cycle

The life cycle of a container follows these steps:

1. Create – A container is created from an image using the docker create command.
2. Start – The container starts running using the docker start command.
3. Run – A new container can be started directly using docker run.
4. Pause/Unpause – Containers can be temporarily paused and resumed.
5. Stop – The container can be stopped using docker stop.
6. Restart – A stopped container can be restarted.
7. Kill – A container can be forcefully stopped using docker kill.
8. Remove – Containers that are no longer needed can be deleted using docker rm.

Benefits of Docker

1. Portability
 - Containers can run on any platform that supports Docker.
 - Applications behave consistently across different environments.

Experiment 9

Aim: To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with containers.

2. Efficiency

- Containers share the host OS kernel, reducing overhead and improving performance.
- They consume fewer resources compared to virtual machines.

3. Isolation

- Each container runs in its own isolated environment, preventing dependency conflicts.

4. Scalability

- Applications can be scaled up quickly by launching multiple containers.
- Docker enables automatic load balancing in large-scale deployments.

5. Consistency

- Ensures that the application runs the same way in development, testing, and production.
- Eliminates the "works on my machine" problem.

Docker Engine:

At the core of Docker is the Docker Engine, which is responsible for building, running, and managing containers. It consists of the Docker daemon, which manages containers, images, networks, and volumes, and the Docker client, which allows users to interact with the daemon through the Docker API.

Docker Images:

Docker images are read-only templates used to create containers. They contain the application code, runtime, libraries, dependencies, and other files needed to run the application. Images are built using Dockerfiles, which are text files that define the steps needed to create the image.

Experiment 9

Aim: To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with containers.

Experiment 9

Aim: To understand Docker Architecture and Container Life Cycle, install Docker and execute docker commands to manage images and interact with containers.

The image consists of two screenshots of a terminal window. The top screenshot shows the user at the prompt [ec2-user@ip-172-31-75-31 myapp]\$ listing files (ls) and then opening the Dockerfile (vi Dockerfile). The bottom screenshot shows the content of the Dockerfile, which includes a FROM nginx instruction and a COPY instruction to copy index.html to /usr/share/nginx/html. The terminal window has a dark background with a mountain landscape. The top bar of the terminal window shows the document title as 'Documents — ec2-user@ip-172-31-75-31:~/myapp — ssh -i LinuxMachine1One.pem ec2-user@ec2-3-235-17-143.compute-1.amazonaws.com'.

```
[ec2-user@ip-172-31-75-31 myapp]$  
[ec2-user@ip-172-31-75-31 myapp]$ ls  
Dockerfile  demo.html  index.html  
[ec2-user@ip-172-31-75-31 myapp]$ vi Dockerfile
```

```
FROM nginx  
COPY index.html /usr/share/nginx/html
```

-- INSERT -- 2,38 All

2023/03/14 01:03:47 [notice] 1#1: signal 17 (SIGCHLD) received from 29
2023/03/14 01:03:47 [notice] 1#1: worker process 29 exited with code 0
2023/03/14 01:03:47 [notice] 1#1: exit
[ec2-user@ip-172-31-75-31 myapp]$
```

```
[ec2-user@ip-172-31-75-31 myapp]$
[ec2-user@ip-172-31-75-31 myapp]$ docker run -d -p 8080:80 myapp
f31fe21f8fc1a77ee768f2604ab695bc8e87733d95a587a62b482c3cd9fa11e6
[ec2-user@ip-172-31-75-31 myapp]$
[ec2-user@ip-172-31-75-31 myapp]$ docker ps
CONTAINER ID   IMAGE     COMMAND                  CREATED        STATUS        PORTS
f31fe21f8fc1   myapp     "/docker-entrypoint..." 7 seconds ago  Up 6 seconds  0.0.0.0:8080->80/tcp, :::8080->80/tcp
[ec2-user@ip-172-31-75-31 myapp]$
```

CONCLUSION: Thus, we have successfully installed Docker and execute docker commands to manage images and interact with containers.
